

I'm a licensed amateur radio operator - callsign KC0DGY - with hopes of one day upgrading to privileges that will include the high frequency bands. Unfortunately if power companies are allowed to relax their Part 15 requirements and begin to distribute high speed internet data over power lines, there will be little HF for me to work. Just working 6 meters as well as listening to shortwave, I already have about an S-4 noise floor and can't imagine how bad it will get if every power line is radiating an additional couple of S units from 10 Khz and on up. Docket 03-104 is simply a poorly engineered poorly thought out plan and I hope it is rejected by the Commission.

Thank You!

Kent Peterson
